E-Mail: dnfs@kilimo.go.tz
Dar es Salaam, Tanzania

Main Highlights

- ◆ *The 2010/11 Final Food Crop Production Forecast amounts 12,972,220 tonnes grain equivalent of which 7,033,498 tonnes constitute cereals and 5,938,721 tonnes comprise non-cereals. Requirement for 2011/12 marketing year amounts 11,532,217 tonnes of which cereals make up 7,238,319 tonnes and non-cereals are 4,293,898 tonnes. Based on these availability and requirement figures, a self sufficient status of 112% is evident in terms of total food crops is attainable whereby cereals make up 97% and non-cereals make up 138%. In terms of gap surplus analysis, this is respectively, 1,440,003 tonnes surplus of total food, 204,821 tonnes gap of cereals and 1,644,824 tonnes surplus of non-cereals.*
- ◆ *As cautioned earlier the forecast is sensitive to vuli performance. Based on this Final forecast, the 2011 Vuli normal contribution revises to 2,093,754 tonnes which is 29% Bimodal area perspective or 16% national aggregate perspective. As of current availability, it contributes 24% Bimodal areas perspective or 13% national aggregates perspective which amounts 1,695,994 tonnes. Compared to preliminary forecasts, the figures imply a 19% draw down from normal which is 397,761 tonnes vs the 450,000 tonnes draw down predicted earlier in June, 2011.*
- ◆ *An analysis of carryover-stocks (COS) shows that, on the eve of new marketing year 2011/12 (i.e. the midnight of 1/06/11) a total of 787,908 tonnes food stock was carried over into 2011/12 marketing year of which 189,966 tonnes was held in NFRA (National Food Reserve Agency) warehouses while 203,988 tonnes was held by private stockists and 393,954 tonnes was estimated as farm retention. Added to the 1,440,003 tonnes final forecast of food surplus arrived at as above, the total food available, over and above national requirement is, 2,227,911 tonnes which is higher than the Preliminary estimate of 2,099,312 tonnes.*
- ◆ *At sub-national level, there is evidence to indicate that: 7 regions will be definitely surplus, 8 regions will be definitely self-sufficient and 6 regions will be definitely deficit. Here and there, pockets of vulnerable areas are signaled in 45 districts in 11 regions.*
- ◆ *Compared to preliminary forecasts, total production rises by 1% mainly due to observed increase in maize (5%), rice (2%) and sorghum (1%). A decline has also been observed in pulses (3%), cassava (1%) and potatoes (1%). The changes for cereals are broadly due to stable climate that prevailed towards harvest the stage which was yet to be observed during preliminary forecast in May 2011, and predominantly favoured masika agriculture around bimodal areas. However this situation was not specifically so in North eastern regions of Arusha and Kilimanjaro which are in the forefront with negative impact of climate change in Tanzania. The local level changes see Dodoma and Coast regions swapping respective positions of Self Sufficiency and deficit status predicted earlier leaving the number of regions intact in surplus, self sufficiency and deficit status. Further down, vulnerability drops from 56 districts indicated earlier to 45.*
- ◆ *Compared to previous season, production increase of 5% has been observed in total food (21% increase in non-cereals and 5% in cereals. Specific cases of increase were mainly notable in double digits percentage values e.g. in wheat (81%), in potatoes (39%) and in pulse (30%), while the decline was evident in millets (16%) and in rice (14%). Other single digit changes are as per Appendix 8. The 5% broad gain is due to good rains in respect of*

timely onset and a fairly appropriate distribution experienced over the season.

- ◆ *Closer monitoring of food situation will need to be enhanced to keep food security management abreast of changing conditions that are both positively and negatively impacting on national and sub-national level food security. The monitoring in this regard should not prioritize specific areas but rather, spread over the whole country in an attempt to capture tangible opportunities and challenges accruing from market forces surrounding comprehensive food chain in Tanzania.*

The 2011/12 Forecast of Food Availability

During the month of December, 2011 the National Food Security Division (Crop Monitoring and Early Warning) carried out a regular preliminary food crop production forecast survey to ascertain food crop harvest status for 2010/11 and the corresponding availability for 2011/12. The interest was to determine the final production status concluded through capturing the effect of influential crop production factors that ruled over the growth stages from seed germination to maturity.

The exercise involved collection of the 2010/11 data and information from 18 regions including bimodal areas of Kagera, Mwanza, Mara, Kilimanjaro, Arusha, Tanga, Morogoro, Coast, Dar es Salaam, where vuli and masika crop patterns are well defined; Iringa, Kigoma, Manyara, Mtwara, Rukwa, Ruvuma and Tabora where unimodal crop patterns are well defined and Shinyanga and Mbeya where the bimodal and unimodal patterns do co-exist. While bimodal areas served to capture impacts of crop development factors over the flowering and grain filling stages towards maturity, the unimodal areas were particularly selected based on observed potentials to generate surplus and attempted to explore on tradable food availability and market challenges surrounding surpluses.

The survey was done in collaboration with Regional Agricultural Advisors (RAAs) and the District Agricultural and Livestock Development Officers (DALDOs) partly through routine crop monitoring and early warning tools and partly through actual fielding of MAFC teams of experts to ground proof on the 2011/12 market availability of the 2010/11 food production and the 2011/12 in-field crop take-off of (msimu) as well as crop performance (vuli). Comprehensive analyses covering different retrievals were undertaken and results are presented in this report.

The 2011/12 Crop Season Onset

The survey also went beyond the 2011/12 food availability and attempted the detective work towards the 2011/12 crop season take off and the likely 2012/13 food security outlook. By the time of survey, bimodal areas had potential information regarding vuli crop while in unimodal areas msimu season was in the onset and the 2011/12 crop was adequately covered in terms of season take-off activities e.g. land preparation and seed germination stages of crop growth and development towards implementation of 2011/12 crop targets.

The results concentrate on national and regional level food status with main highlights of regions and districts bearing vulnerable areas. Further results highlight on regions where crop season onset is indicating positive signs of crop-rainfall response.

The 2010/11 Food Production Forecast

From the analysis, it has been found that **12,972,220** tonnes of food crops (in grain equivalent terms) will be available from farm production comprised of **7,033,498** tonnes of cereals¹ and **5,938,721** tonnes of non-cereals² (Table 1, Figure 1, Appendix 1 and Appendix 2) and will meet national food requirement amounting **11,532,270** tonnes of food by **112** percent implying a **1,440,003** tonnes of surplus food (Table 1, Appendix 2).

1 The cereal crops covered under CMEWS include maize, sorghum, millets, rice and wheat.

2 The non-cereals include pulses, cassava, banana and potatoes

Figure 1: Tanzania Final Food Crop Production Forecast for 2010/11 Crop Season (With Cropwise Proportional Contribution)

Table 1: The 2010/11 National Level Final Food Crop Production versus Requirement and gap/surplus analysis for 2011/12 (GRAIN EQUIVALENT)

Cereals	Maize	Sorghum&Millets	Rice	Wheat	Cereals
Production	4,340,823	1,118,609	1,461,408	112,658	7,033,498
Requirement	4,501,740	1,695,555	816,648	224,376	7,238,319
Gap (-)/ Surplus(+)	-160,917	-576,946	644,759	-111,717	-204,821
Non-cereals	Pulses	Banana	Cassava	Potatoes	Non-cereals
Production	1,632,329	1,047,945	1,548,841	1,709,606	5,938,721
Requirement	743,156	778,305	1,943,249	829,188	4,293,898
Gap (-)/ Surplus(+)	889,174	269,640	-374,859	894,608	1,678,563
TOTAL	<i>Cereals</i>	<i>Non-cereals</i>			TOTAL
Production	7,033,498	5,938,721			12,972,220
Requirement	7,238,319	4,293,898			11,532,217
Gap (-)/ Surplus(+)	-204,821	1,644,824			1,440,003

The assessment shows that cereal deficit prevails but at a lower level of 204,821 tonnes than preliminary revelation of 413,739 tonnes. Of the shortage, 160,917 tonnes is maize (**Table Na. 1 and Appendix Na. 6**).

It is important to note that maize deficit is not as sounding as it appears because the carryover stocks (COS) is mainly maize (see COS analysis below). Maize stock is one of the most tradable food stocks that continues to curb shortages arising from farm failure to meet cereal requirement in the country.

Carry-over Stocks

Carry-over Stocks (COS) are all food stocks that were found in granaries, shops, farm fields, households etc either in reserve or on in passing over for business or just awaiting consumption during the eve of the accounting period as the period transits over to the next. In Tanzania this is composed of Public, Private and farm Retention.

An analysis of Carryover stocks (COS) shows that, as the outgoing marketing year 2010/11 ended (31/05/11) a total of 787,908 tonnes food stock was carried over into new marketing year, 2011/12 (01/06/11) of which 189,966 tonnes was held in NFRA premises while 203,988 tonnes was held by private stockists and 393,954 tonnes was estimated as farm retention (Figure 2). Of the total monitored stocks, which is half the total stock, maize constitutes the major share 50%, followed by wheat (46%) then pulses (3.9%), rice 0.8% and sorghum (0.002%) the minor.

Figure 2: Carryover stocks (COS) Analysis as of 31 May, 2011 –Final Forecast for 2011/12 Revision

Adding the COS to the 1,440,003 tonnes food surplus determined through final forecast as above, the total food available, over and above national requirement is 2,227,911 tonnes.

The 2011/12 Vuli Effect

Basic facts about Vuli Contribution to Food Production

Tanzania has 2 types of rainfall patterns (Bimodal and Unimodal) with 3 cropping seasons viz. *vuli*, *masika* and *msimu*. There are regions which are totally bimodal and those which are wholly unimodal. But there are also those regions where an intermixture prevails between unimodal and bimodal regions or between unimoda and bimodal districts. Whether in partial or in wholesome the cropping seasons that follow rainfall regimes are broadly generalized as following regional

and district boundaries. On the ground, this is not strictly so but for statistical convenience guided by availability of basic data *vuli*, *masika* and *msimu* have been proportionately apportioned in these districts and later appropriately computed to give regional level estimates of normal and current *vuli* contributions. Overtime the norms and current year values have been changing based on the process of updating and recalculation while taking cognizance of data collected during final forecast survey.

Based on these proportionate *vuli* contributions tonnage values have been presented alongside crop production forecast both as regional values and national values. The proportionation process has also gone further and estimated the bimodal area values which have been useful is indication appropriate food security gain/loss depending on the proximity at which additional *vuli* output impacts on the consumption year. When bimodal areas alone (the immediate user of *vuli* crop) are considered the proportion becomes bigger than when national aggregate value (which includes immediate users and other users in remote regions) due to denominator considerations. With less number of bimodal *flavored* regions (11) you get higher proportion than when you consider all national regions (21). The presence of three cropping seasons has a Risk spreading effect this is good for *strategic food security management*.

During preliminary forecast normal *vuli* contribution stood at 27% Bi-modal area (BMA) perspective (or 17% National aggregate (NA) perspective while current value was approximately 22% BMA or 13% NA. Correspondingly the tonnage values are 2,209,187 and 1,781,151 tonnes which are about 19% away from each other. Thereafter, following improved crop performance, final forecast reveals that, normal contribution increased to 29% BMA while the NA perspective increased to 16% or currently 24% BMA perspective and 13% NA perspective See Figures 3a and 3b below.

Figures 3a National *Vuli* contribution drops in tonnage terms

Figures 3b National Vuli contribution rises in Percentage terms

This analysis warns of rising BMA values from 27-29 normally and 22-24 currently but of falling NA values from 16% to 17% normally and 14-13% currently. While there seems to be a positive national picture there is a negative picture on the bimodal perspective. The policy towards this is to think more on national gains associated with bimodal areas than bimodal specific gains.

Sub-national level

At sub-national level, the 2010/11 production is expected to meet food requirement upto end of 2011/12 marketing year in 15 regions while deficit status is detected in 6 regions namely (with SSR levels in brackets) Dar es Salaam (5%), Arusha (89%), Shinyanga (98), Dodoma (98), Mara (99), Mwanza (99). The 15 regions okayed in SSR status are categorized into 8 self sufficient regions with SSR level of 101%-116% and 7 surplus regions with SSR levels of 122%-153% (Figure 3, Appendix 2).

**Figure 4: Total Food Supply Forecast for the 2011/2012 Marketing Year
(Based on 2010/11 Final Food Crop Production Forecasts)**

Based on final food crop production forecast, total food supply is expected to satisfy requirements for 2011/12 in 15 regions of Mbeya, Rukwa, Ruvuma, Mtwara, Iringa, Kigoma, Kagera, Morogoro, Kilimanjaro, Manyara, Tanga, Tabora, Lindi, Singida, Coast. While Rukwa, Ruvuma, Mtwara, Iringa, Kigoma, Kagera are surplus, the rest are self sufficient. The deficit regions with respective SSRs in brackets are Dare es Salaam (5%), Arusha (89%), Shinyanga (98%), Dodoma (98%), Mara (99%), Mwanza (99%). Vulnerable areas have been detected in 20 districts in deficit regions, 22 districts in self sufficient regions and 3 districts in surplus regions.

The changes have incidentally shifted some regions in terms of status quo. For example Dodoma and Coast regions which were hitherto considered self sufficient and deficit respectively swap positions.

Time series analysis

Time series analysis shows that, compared to previous season, total production increased by 5% (81% in wheat, 39% in potatoes, 30% in pulses, 7% in banana and 6% in cassava) probably attributed to fairly good rains in respect of timely onset and a fairly appropriate distribution experienced in the areas growing these crops. Even then, a decrease of approximately 5% is notable in cereals (16% in millets, 14% in rice and 3% in maize, the national staple) (See Appendix 8).

Compared to trend values computed from 1992/93-2009/103, all food crop categories lie above whereby total tonnage is higher by 12%, cereals are higher by 17% and non-cereals lie above by 7%. Consistently, all non-cereals except cassava lie positive to trend line by a minimum of 6% (sorghum) to the maximum of 30% (rice). Trend values and other measures of time series analysis for different crops are as per Appendix 8.

Further back to 1994/95, the SSR has been recorded at national level and this is shown on Appendix 9. This record is very useful when indicative management as of where to start is been sought. For example current year SSR level was encountered in 2006/07 and this is where to start if any baseline initiatives to manage food security is to be arranged at least at national level. Other years of experience are as per the chart (Appendix 9).

Vulnerability

An analysis of monthly routine retrieval system (RRS1) and management based snapshot information (TSA), vulnerable hotspots have been detected in 45 districts in 11 regions including 4 definitely deficit regions, 5 self sufficient regions and 2 surplus regions. Vulnerability ranks highest in Arusha, Coast, Kilimanjaro and Tanga where over one third of all detected vulnerable districts are located followed by an intermixture of 3 deficit regions of Mwanza, Shinyanga and Mara, 2 self sufficient regions of Tabora and Manyara and surplus regions of Kagera and Mtwara. Categorically, vulnerable areas have been detected in 20 districts in deficit regions, 22 districts in self sufficient regions and 3 districts in surplus regions.

Compared to Preliminary forecasts, National level SSR rises by 1 unit, regional level rises by up to 9 units in 10 regions, remains unchanged in 4 regions and drops by up to 17 units in 7 regions. Vulnerability improved at national level as well as in 9 regions while it stabilized in 10 regions and worsened in 2 others (See Appendix 10).

³ a reasonable period of reliable food crop statistics

Conclusion and Recommendations

The survey has put it clear that SSR is 112% with 1,440,003 tonnes of available which together with COS amounting 787,908 tonnes adds up to 2,227,911 tonnes. Amidst this national high-level status of self sufficiency, the sub-national levels bear a mixed status. There is an evidence to indicate that 7 regions will be definitely surplus bearers, 8 regions will be definitely self-sufficient in food and 6 regions will be definitely deficit. Here and there, pockets of vulnerable areas are signaled in 45 districts in 11 regions.

Decisions regarding management of food security over 2011/12 will depend on 3 major considerations viz. Severity of vulnerability and intervention needs in terms of food needs and probably input support in vulnerable areas, Capacity to avail market access to surplus food in surplus areas and the status of new season especially in respect of input availability.

With this big surplus over and above national food requirement any surplus areas are likely to suffer market inhibition unless some strategic interventions are deployed. Towards this strategy, the available high demand market include domestic market including Dar es Salaam, Arusha, Shinyanga, Dodoma, Mara, Mwanza regions which are definitely deficit stricken and, Tanga, Coast, Tabora and Manyara where vulnerable areas are reportedly rampant. Besides the locally available market, the external market is also looming on the neighbourhood especially in most of northern neighbouring countries where food shortage is increasingly unbridled. The regions where surpluses are high in total food include, Mbeya, Rukwa, Ruvuma, Mtwara, Iringa, Kigoma and Kagera. In terms of maize (the most popular staple both in Tanzania and across surrounding nations), surpluses are high in 9 regions namely: Mbeya, Iringa, Rukwa, Tanga Manyara, Ruvuma, Morogoro, Tabora, Kigoma.

- As to the tradable surplus that is available in these regions and perhaps others, a *Tradable Surplus Survey* has to be conducted focusing at detailed data on food availability and price trends. This can borrow from tools devised by MAFC teams and attempted during final forecast exercise.
- In view of the relatively incapable capacity for NFRA to capture all surpluses in maize and other cereals in major surplus generating regions and also incapable capacity to make available and distribute *inputs*, freer search for market access should be strategically attempted while closely monitoring food situation across the country in favour of surplus bearers in the country. This will do the needful for farmers who have started gaining from the fruitful subsidy driven initiatives in Southern highlands of Tanzania etc towards commercial orientation. They have to sell now to get money for purchasing inputs now needed for the new season. If the relatively low prices available now are not as rewarding as for later prices then farmers will need a guarantee based on surplus available. This may be well done through a warehouse receipt system which is currently being spearheaded in the country.
- In view of the notable strengths in external market it is recommended that systems are devised such that trader's access to local surpluses continues to benefit farmers. Amidst the naturally booming opportunity of the external trade, vigilance should not be overlooked. Over the foreseeable externally eased trade, a closer food situation monitoring should be enhanced and strengthened in order to operate in a more detective manner focused to markets, warehouse and cross-border activity for a quick counteraction if need be.

Appendix 2: Tanzania Food Supply Analysis and Self Sufficiency Ratio for 2011/12

(Based on the 2010/11 Final Food Crop Production Forecasts)

REGION	Total Cereals				Total Non-cereals				Total Food				Deficit indicator (%)	REGION	COMPARED TO PRELIMINARY FORECAST

Appendix 9: Self Sufficiency Variations Overtime in Tanzania, 1994/95-2011/12 (Deviation from 100%)

Appendix 10: Final Food 2011/12 Self Sufficiency and Associated Vulnerability vs Preliminary Predictions

REGION	Final Forecast		Preliminary Forecast		change		Status Interpretation	
	SSR (%)	VA districts	SSR (%)	VA districts	SSR	VA	Self sufficiency	Vulnerability
Arusha	89	7	90	7	-1	0	Declined	Stabilized
Coast	101	5	94	2	6	3	Improved	Tightened
Dar es Salaam	5		4	3	1	-3	Improved	Eased
Dodoma	98		115	2	-17	-2	Declined	Eased
Iringa	130		130	2	0	-2	Stabilized	Eased
Kagera	122	2	122	2	0	0	Stabilized	Stabilized
Kigoma	125		126		-1	0	Declined	Stabilized
Kilimanjaro	116	5	117	5	-1	0	Declined	Stabilized
Lindi	109		109		0	0	Stabilized	Stabilized
Manyara	113	3	108	4	5	-1	Improved	Eased
Mara	99	3	98	4	1	-1	Improved	Eased
Mbeya	153		153	2	-1	-2	Declined	Eased
Morogoro	116		114		2	0	Improved	Stabilized
Mtwara	132	1	132	1	0	0	Stabilized	Stabilized
Mwanza	99	5	95	6	4	-1	Improved	Eased
Rukwa	153		154		-1	0	Declined	Stabilized
Ruvuma	149		148		1	0	Improved	Stabilized
Shinyanga	98	5	89	8	9	-3	Improved	Eased
Singida	108		116	3	-8	-3	Declined	Eased
Tabora	110	4	109	4	1	0	Improved	Stabilized
Tanga	112	5	106	1	6	4	Improved	Tightened
TANZANIA	112	45	111	56	1	-11	10,4,7	9,10,2

Note: Colours in status columns: Green is improvement, yellow means unchanged (stabilization) and red means worsening (tightening/declining).

While self sufficiency status improved at national level, it did same in 10 regions, stabilized in 4 regions and worsened in 7 regions. Vulnerability improved at national level as well as in 9 regions while it stabilized in 10 regions and worsened in 2 regions.

In summary:

Based on the 2010/11 Final Food Crop Production Forecast Survey, Tanzania during 2011/12 will be 112% self sufficient. With 1,440,003 tonnes of available surplus which together with carry-over stocks amounting 787,908 tonnes available from public, private and household retention adds up to 2,227,911 tonnes. Amidst this national high-level status of self sufficiency, the sub-national levels bear a mixed status. There is evidence to indicate that 7 regions will be definitely surplus bearers, 8 regions will be definitely self-sufficient in food and 6 regions will be definitely deficit. Here and there, pockets of vulnerable areas are signaled in 45 districts in 11 regions.

Maeneo Tete, 2011/12 - kulingana na Tathmini ya Uvunaji 2010/11 (Final Forecast).

Na.	Mkoa	Kiwango cha Utoshelev	Idadi ya Halmashauri	Orodha ya halmashauri zenye maeneo tete
1	Arusha	89	7	Arusha DC, Arusha MC, Karatu, Longido, Meru, Monduli, Ngorongoro
2	Tanga	112	5	Lushoto, Mkinga, Pangani, Kilindi, Tanga TC
3	Shinyanga	98	5	Shinyanga M, Shinyanga V, Kishapu, Kahama, Meatu
4	Mwanza	99	5	Magu, Ilemela, Nyamagana, Geita, Misungwi
5	Kilimanjaro	116	5	Hai, Moshi V, Mwanza, Same, Siha
6	Pwani	101	5	Kibaha TC, Kibaha DC, Bagamoyo, Mafia, Rufiji
7	Tabora	110	4	Nzega, Igunga, Sikonge, Tabora M
8	Mara	99	3	Musoma V, Musoma M, Bunda
9	Manyara	113	3	Babati DC, Mbulu, Simanjiro
10	Kagera	122	2	Muleba, Bukoba V
11	Mtwara	132	1	Masasi
TANZANIA		Mikoa yenye Utoshelevu (SSR=112%), maeneo tete (Mikoa 11, Halmashauri 45)	Maeneo tete 11: 2 kijani, 5 njano, 4 nyekundu Wilaya zenye maeneo tete 45: 3 kijani, 22 njano, 20 nyekundu.	Wakati nchi ina SSR ya 112%, mikoa 11 ina maeneo tete katika Wilaya 45

Wakati nchi inajitosheleza kwa chakula kwa viwango vya 112%, mikoa 11 itakuwa na maeneo tete. Kati yake, mikoa 2 ni ile yenye chakula cha ziada, 5 inajitosheleza na 4 inakabiliwa na uhaba dhahiri. Wakati huo huo, taarifa za kuwepo kwa maeneo tete zinaainisha kwamba halmashauri 45 zitaathirika na hali tete ya chakula kwa viwango mbalimbali. Kati yake, halmashauri 3 ziko katika mikoa yenye ziada, halmashauri 22 ziko katika mikoa inayojitosheleza kwa chakula na halmashauri 20 ziko katika mikoa yenye uhaba dhahiri.

Ikilinganishwa na Tathmini ya Awali, hali ya kujitosheleza kwa chakula iliimarika kitaifa, hali ambayo pia ilitawala katika mikoa 10. Hali ya chakula ilibakia bila mabadiliko katika mikoa 4 na kudorora katika mikoa mingine 7. Hali tete (Vulnerability) iliendelea kuwa nafuu kitaifa na hali kadhalika katika mikoa 10. Hali tete ilibakia bila mabadiliko katika mikoa 9 na kudorora zaidi katika mikoa 2.
